

# Product Requirements Document

## (Gestionly)

### 1. Overview

**Product Name:** Gestionly

**Prepared By:** Anas Fady

**Date:** 01-05-2026

### 2. Objective

{objective}

### 3. Stakeholders

| Name                      | Role                                    |
|---------------------------|-----------------------------------------|
| Anas Fady Elmanzallawy    | Front-End Developer and Product Manager |
| Jose Luis Fernandez Perez | CEO and Back-End Developer              |

### 4. Features

{feature#1}

#### Feature: Unit & Residency Management El administrador de fincas digital

**Description:** This feature allows Administrators to map the physical layout of the community, establish the legal financial weights (*coeficientes*) for each unit, and manage the relationship between Owners (*Propietarios*) and Tenants (*Inquilinos*).

- Stakeholders:
  - President: register owners, set budgets, create and close votes, assign responsibilities and report and resolve incidents.
  - Owner: Access to voting, financial commitments and inviting for tenants
  - Tenant : Restricted for reporting incidents and

**Priority:** Highest

**Status:** {status}

{/features}

## □ Technical Requirements

{#techRequirements}

- The "Inquilino" Handover: When an Owner removes a Tenant, the Tenant's access must be revoked immediately, and historical data (messages/reports) must be archived for legal protection.
- Mass Import: Support for CSV/Excel upload to register the entire building at once (crucial for onboarding large *comunidades*).
- Visual Map: (Optional/Future) A dashboard view showing a color-coded floor plan (Green = Paid, Red = Debt, Blue = Rented).

{/techRequirements}

## □ Business Requirements

{#businessRequirements}

- **Admin Flow**
  - Unit Profile: Fields for Block, Floor, Door, and Type (Apartment, Commercial Local, Parking, Storage).
  - Weightage (Coefficient): A numerical field (up to 4 decimal places) representing the unit's share of the total building (e.g., \$4.25\%\$).
    - *Logic*: The system must validate that the sum of all units equals 100%.
  - Financial Commitments: A toggle to define if the unit is exempt from specific costs (e.g., ground floor shops often don't pay for elevator maintenance).

- 
- **Owner Flow**
    - *Primary contact for legal notices and voting.*
    - *Access to financial statements, debt status, and recibos.*
    - *Ability to "Invite a Tenant" via email/phone.*

- 
- **Tenant Flow**
    - *Linked to a specific Unit ID but with restricted permissions.*
    - *Permissions: Can report damages (incidencias), view community rules, and receive general notices.*
    - *Privacy: Cannot see the Owner's payment history or vote in the Junta (unless delegated).*

- 
- **Expense Distribution**
    - *When an admin enters a total invoice (e.g., \$1,000\$ for roof repair), the system must automatically generate a "Draft Expense" per unit based on:*

$$\text{Unit Share} = \text{Total Expense} \times (\text{Unit Coefficient} \div 100)$$

- *Automated Billing: Integration with the unit profile to generate monthly community fees (cuotas) based on the annual budget divided by unit weight.*

{/businessRequirements}

## □ User Stories

{#userStories}

- **As an Admin:** I want to input the ownership percentage for each apartment so that monthly fees are calculated automatically and fairly.
- **As an Owner:** I want to add my tenant's profile to the system so they receive maintenance alerts without seeing my private financial data.
- **As a System:** I need to automatically split community expenses based on the unit "weight" to prevent manual accounting errors

**Acceptance Criteria:**

- Reduce building onboarding from hours (manual) to <10 minutes (bulk upload).
- Zero manual corrections needed for monthly fee distributions.
- % of Owners who successfully register their tenants within 30 days of onboarding.

{/userStories}

{features#2}

## Feature: Voting System

**Description:** The goal is to digitize the community voting process (Juntas de Propietarios), allowing for both synchronous and asynchronous decision-making. This feature must ensure legal compliance with property laws (like Spain's *Ley de Propiedad Horizontal*) while maximizing participation.

Stakeholders:

President: Create votes, set deadlines, attach *presupuestos*, and close polls.

Owner: Cast votes, view results (if public), and delegate their vote (*voto delegado*)

Tenant : View-only access to results (optional based on community settings); no voting rights

**Priority:** Highest

**Status:** {status}

{/features}

## □ Technical Requirements

{#techRequirements}

- Once a vote is cast, it cannot be edited (only replaced if the admin allows "revote" before the deadline).
- Data must be encrypted at rest to ensure privacy and prevent tampering by database administrators.
- Option for "Secret Ballots" vs. "Open Voting" depending on the community's preference for a specific motion

{/techRequirements}

## □ Business Requirements

{#businessRequirements}

### ○ Admin Flow

- Input Fields: Title, detailed description, category (e.g., *Derramas*, Maintenance, Rules), and attachments (PDF/Images).
- Voting Logic: Support for multiple types:
  - *Binary*: Yes / No / Abstain.
  - *Multiple Choice*: Selecting between several contractor quotes (*presupuestos*).
- Quorum Requirements: Ability to set minimum participation thresholds (Requirements).
- Weighted Voting: The system must calculate results based on property coefficients (percentage of ownership), not just "one person, one vote."

---

### ○ Owner Flow

- *Identity Verification*: Users must be logged into a verified account linked to a specific property unit.
- *Vote Delegation*: Interface for an owner to formally assign their vote to another vecino or the President.
- *Real-time Tracking*: A progress bar showing current participation rates (without necessarily showing the trend, to avoid bias).

{/businessRequirements}

## □ User Stories

{#userStories}

**As an Owner**, I want to see the contractor's PDF quote directly on the voting screen so I can make an informed choice.

**As a Community Manager**, I want the system to calculate the *coeficiente* totals automatically so I don't have to use a manual spreadsheet.

**As a Busy Neighbor**, I want to vote via a "One-Tap" push notification because I cannot attend the 9:00 PM meeting.

### Acceptance Criteria:

- Participation Rate: Increase average voter turnout by at least 40% compared to physical meetings.
- Time-to-Decision: Reduce the average time to approve a budget from weeks to < 5 days.
- User Friction: % of users who complete a vote within 60 seconds of opening the notification.

{/userStories}

## □ Constraints

{#constraints}

- Audit Trail: Every vote must generate a unique ID, timestamp, and IP log.

- **Certificate Generation:** Upon closing a vote, the system automatically generates a PDF summary (Acta) for the building's records.
- **Notification Trigger:** Push notifications sent when a vote opens, 24 hours before closing, and when results are finalized

{/constraints}

{features#3}

## **Feature: Automated Invoicing & Collections #Continue the features**

**Description:** To automate the generation, distribution, and collection of recurring community fees (*cuotas*) and one-time extraordinary assessments (*derramas*). The system integrates with a payment gateway to ensure real-time reconciliation and reduce delinquency.

Stakeholders:

**President:** Create Invoice, Generate the invoice and view the payment status, view all invoices in system and ability to download them and filter through dates and categories.

**Owner:** Pay the invoices throughout various payment channels, Receive invoice through email, view all invoices in system and ability to download them and filter through dates and categories.

**Priority:** Highest

**Status:** {status}

{/features}

## ☐ **Technical Requirements**

{#techRequirements}

- Server-side generation of immutable PDF files stored in secure S3 buckets.
- Must implement Webhooks to listen for payment success/failure from the Gateway.
- Logic to block owners from paying only a portion of their total debt.
- An "Accounting Ledger" view for owners to see all past receipts and payments.

{/techRequirements}

## ☐ **Business Requirements**

{#businessRequirements}

- **Invoice Generation Engine**
  - **Template Support:** Automatic generation of professional PDF invoices containing:
    - Community CIF/Tax ID and Owner details.
    - Breakdown of concepts (e.g., Water, Cleaning, Reserve Fund).

- Legal footer required by local tax laws.
- **Billing Cycles**
  - *Recurring*: Monthly, quarterly, or annual community fees.
  - *Ad-hoc (Derramas)*: One-time charges for specific projects (e.g., "Roof Repair").
- **Auto-Calculation:**
  - The system pulls the unit's coefficient and multiplies it by the total\_budget to populate the invoice amount automatically.

---

#### ○ **Payment Gateway Integration**

- Supported Methods: Integration with Stripe, PayPal, or local bank APIs (SEPA Direct Debit for Europe).
- "Pay Now" Link: Every digital invoice must include a secure, unique link to a checkout page.
- Auto-Reconciliation: When a payment is successful, the invoice\_status must update from Pending to Paid in real-time without manual admin intervention.

---

#### ○ **Collection & Debt Management**

- Automated Reminders: Trigger-based emails/notifications (e.g., 3 days before due date, 1 day after "Overdue").
- Late Fees: Optional logic to apply a percentage-based penalty or fixed fee for late payments (*intereses de demora*).
- Moroso Status: Automatic flagging of units as "Delinquent" if invoices remain unpaid after \$X\$ days, affecting their voting rights in the "Voting Module."

---

#### ○ **Admin Flow**

- Showing
  - Total Collected vs. Total Pending for the month.
  - List of top debtors (*lista de morosos*).
  - "Send All" button to dispatch invoices to the entire building in one click.

---

#### ○ **Owner Flow**

- *Wallet that shows*
  - *current balance*
  - *upcoming bills*
  - *Saved Payment Methods*

{/businessRequirements}

## □ **User Stories**

{#userStories}

- **As an Admin:** I want to create a derrama (special assessment) and have the system calculate every owner's share instantly based on their coefficient.
- **As an Owner:** I want to receive my invoice via push/email and pay it with one click using my saved credit card or Apple/Google Pay.

### **Acceptance Criteria:**

- Reduce the average time it takes for an owner to pay from 15 days to <5 days.
- % of invoices reconciled without manual admin "marking as paid."

- Zero discrepancies between the Gateway total and the System's "Total Collected" report.

{/userStories}

## □ Constraints

{#constraints}

- Payment info (Credit Card numbers) must **never** be stored on the app's servers (handled entirely by the PCI-compliant gateway).
- Every invoice issued and payment received must have a permanent, non-deletable log for yearly audits.

{/constraints}

## 9. Assumptions

{#assumptions}

- {assumption}
